Mouse Hematopoietic Progenitor (Stem) Cell Enrichment Set - DM

Product Information
Catalog Number: 558451
Components:

- Biotinylated Mouse Lineage Depletion Cocktail, 5.0 ml, comprising the following biotin-conjugated monoclonal antibodies:
  - Anti-mouse CD3ε, clone 145-2C11
  - Anti-mouse CD11b, clone M1/70
  - Anti-mouse CD45R/B220, clone RA3-6B2
  - Anti-mouse Ly-6G and Ly-6C (Gr-1), clone RB6-8C5
  - Anti-mouse TER-119/Erythroid Cells, clone TER-119

- BD IMag™ Streptavidin Particles Plus - DM, 5.0 ml

Storage Buffer: Aqueous buffered solution containing BSA* and 0.09% Sodium Azide.

Description
The BD IMag™ Mouse Hematopoietic Progenitor Cell Enrichment Set – DM reacts with cells from the major hematopoietic cell lineages, such as T lymphocytes, B lymphocytes, monocytes/macrophages, granulocytes, and erythrocytes. The Biotinylated Mouse Lineage Depletion Cocktail contains biotinylated monoclonal antibodies to mouse CD3ε (CD3ε chain), CD11b (Integrin αM chain), CD45R/B220, CD45/R/B220, Ly-6G and Ly-6C (Gr-1), and TER-119/Erythroid Cells (Ly-76). The BD IMag™ Streptavidin Particles Plus – DM are magnetic nanoparticles that have streptavidin covalently conjugated to their surfaces. This Set is designed for the immunomagnetic enrichment of hematopoietic progenitors from mouse bone marrow by depletion of cells committed to the T- and B-lymphocytic, myeloid (monocytic and granulocytic), and erythroid lineages.1,2,3,4,5,6 The Set contains sufficient reagents to label 10^9 bone marrow cells.

Preparation and Storage
Both the Biotinylated Mouse Lineage Depletion Cocktail and the BD IMag™ Streptavidin Particles Plus - DM should be stored undiluted at 4°C.

Usage
The detailed Magnetic Labeling and Depletion Protocol follows. In summary, the Biotinylated Mouse Lineage Depletion Cocktail simultaneously stains the lineage-committed hematopoietic cells according to their different specificities. After washing away excess antibody, BD IMag™ Streptavidin Particles Plus – DM are added to the cell suspension and bind the cells bearing the biotinylated antibodies. The tube containing this labeled cell suspension is then placed within the magnetic field of the BD IMagnet™ (Cat. no. 552311). Negative selection is then performed to enrich for uncommitted hematopoietic progenitors. Labeled cells migrate toward the magnet (positive fraction), leaving the unlabeled cells in suspension so they can be drawn off and retained (depleted fraction). Additional negative selections are performed to optimize the yield and purity of the depleted fraction. The magnetic separation steps are diagrammed in the Depletion Flow Chart. Both the positive and depleted fractions can be evaluated in downstream applications such as flow cytometry and tissue culture. The antibodies in the Biotinylated Mouse Lineage Depletion Cocktail have been optimized and pre-diluted to provide maximum efficiency for enrichment of bone marrow hematopoietic progenitors.

*Source of all serum proteins is from USDA inspected abattoirs located in the United States.

References
Depletion of lineage-committed cells from mouse bone marrow. BALB/c bone-marrow cells were labeled with the BD IMag™ Mouse Hematopoietic Progenitor Enrichment Set and separated on the BD IMagnet™ (Cat. no. 552311) according to the accompanying Protocol. To demonstrate the efficiency of the depletion, unmanipulated bone marrow cells and the final depleted fraction were stained with APC-conjugated anti-mouse CD117 mAb 2B8 (Cat. no. 553356) to detect hematopoietic progenitors, and with PE-conjugated mAb TER-119 (Cat. no. 553673), PE-conjugated mAb RA3-6B2 (Cat. no. 553089/553090), and PE-conjugated mAb M1/70 (Cat. no. 557397/553311) to detect lineage-commited cells. The percentage of positive cells is indicated in each panel; placement of each marker is based upon staining with the appropriate isotype control (data not shown). The final depleted fraction contains a greatly increased proportion of CD117+ cells and less than 5% of lineage-positive contaminants.

MAGNETIC LABELING AND DEPLETION PROTOCOL

1. Prepare sterile buffers and place on ice.
   a. Cell-staining buffer: Phosphate Buffered Saline supplemented with 3% heat-inactivated fetal calf serum and 0.1% sodium azide
   b. 1X BD IMag™ buffer: Dilute BD IMag™ Buffer (10X) (Cat. no. 552362) 1:10 with sterile distilled water or prepare Phosphate Buffered Saline supplemented with 0.5% BSA, 2 mM EDTA, and 0.1% sodium azide.
2. Aseptically prepare a single-cell suspension from mouse bone marrow. Remove clumps of cells and/or debris by passing the suspended cells through a 70-µm nylon cell strainer.

   Note: The femurs and tibiae of one adult mouse typically yield 20-60 x 10⁶ hematopoietic cells. One mouse will yield approximately 0.3-1.0 x 10⁶ lineage-negative cells.

3. Count the cells and resuspend them in sterile cell-staining buffer at 10 to 20 x 10⁶ cells/ml. Set aside a sample of unstained cells (~5 x 10⁶ cells) to be used in the flow cytometric analysis in Step 17.
4. Add Mouse BD Fc Block™ purified anti-mouse CD16/CD32 mAb 2.4G2 (Cat. no. 553141/553142) at 0.25 µg/10⁶ cells, and incubate on ice for 15 minutes.
5. Add the Biotinylated Mouse Lineage Depletion Cocktail at 5 µl per 1 x 10⁶ cells, and incubate on ice for 15 minutes.
6. Wash the labeled cells with a 10X excess volume of 1X BD IMag™ buffer, centrifuge at 300 x g for 7 minutes, and carefully aspirate ALL the supernatant.
7. Vortex the BD IMag™ Streptavidin Particles Plus - DM thoroughly, and add 5 µl of particles for every 1 x 10⁶ total cells.
8. MIX THOROUGHLY. Refrigerate for 30 minutes at 6˚C - 12˚C.
9. Bring the labeling volume up to 20 to 80 x 10⁶ cells/ml with 1X BD IMag™ buffer.
10. Transfer the labeled cells to a 12 x 75 mm round-bottom test tube (eg, BD Falcon™, Cat. no. 352058), maximum volume added not to exceed 1.0 ml. Place this positive-fraction tube on the BD IMagnet™ (horizontal position) for 8 minutes.
   • For greater volume, transfer the cells to a 17 x 100 mm round-bottom test tube (eg, BD Falcon™, Cat. no. 352057), maximum volume added not to exceed 3.0 ml. Place this positive-fraction tube on the BD IMagnet™ (vertical position) for 10 minutes.
11. With the tube on the BD IMagnet™ and using a sterile glass Pasteur pipette, carefully aspirate the supernatant (depleted fraction) and place in a new sterile tube.
12. Remove the positive-fraction tube from the BD IMagnet™, and add 1X BD IMag™ buffer to the same volume as in Step 9. Resuspend the positive fraction well by pipetting up and down 10 to 15 times, and place the tube back on the BD IMagnet™ for 8 minutes.
   • 17 x 100 mm tube: Place on the BD IMagnet™ for 10 minutes.
13. Using a new sterile Pasteur pipette, carefully aspirate the supernatant and combine with the depleted fraction from Step 11 above. The positive-fraction cells remaining in the original tube can be resuspended in an appropriate buffer or culture medium for downstream applications, including flow cytometry, if desired.
14. Place the tube containing the combined depleted fraction on the BD IMagnet™ for a final 8 minutes.
   • 17 x 100 mm tube: Place on the BD IMagnet™ for 10 minutes.
15. Carefully aspirate the supernatant and place in a new sterile tube. This is the final depleted fraction containing enriched hematopoietic progenitors. The cells are ready to be processed for downstream applications.
16. Samples of the total cell suspension and the positive and final depleted fractions should be analyzed by flow cytometry to evaluate the efficiency of the cell-separation procedure.

NOTES:
- After washing away excess biotinylated antibody, completely aspirate the supernatant. Supernatant left in the tube will increase the labeling volume, which will decrease the efficiency of magnetic labeling.
- When labeling cells with the BD IMag™ Streptavidin Particles Plus - DM, use biotin-free buffer only. Free biotin will compete with the biotinylated antibody for binding to the BD IMag™ Streptavidin Particles Plus - DM.
- Avoid nonspecific labeling by working quickly and adhering to recommended incubation times.

Hazardous Ingredient: Sodium Azide. Avoid exposure to skin and eyes, ingestion, and contact with heat, acids, and metals. Wash exposed skin with soap and water. Flush eyes with water. Dilute with running water before discharge into plumbing.

BD IMag™ particles are prepared from carboxy-functionalized magnetic particles which are manufactured by Skold Technology.
